SUMMARY

Backend engineer with over five years building production APIs and microservices in **Node.js** and **Python FastAPI**. I care about the details that matter in backend work — clean database design, solid error handling, good test coverage, and systems that don't surprise you at 2 AM. I've worked across the stack, collaborated with frontend and DevOps teams in Agile environments, and picked up mentoring and code review responsibilities naturally as teams grew.

TECHNICAL SKILLS

Languages: Python, JavaScript / TypeScript, C#

Backend: Node.js (Express), Python FastAPI, REST APIs, GraphQL, WebSocket, Microservices

Databases: PostgreSQL, MySQL, MongoDB, Redis — schema design, query optimisation

API Quality: Input validation, sanitization, structured error handling, logging middleware

Testing: Unit testing, integration testing, automated test suites — Jest, Pytest

Infrastructure: Docker, CI/CD (GitHub Actions), RabbitMQ, Git, Agile / Scrum

ORM / Data Layer: Prisma, Supabase, pgvector

AI / LLM: LangChain, OpenAI API, Anthropic Claude API, RAG, vector databases

Frontend (support): React.js, Next.js 15, Tailwind CSS, TypeScript

PROFESSIONAL EXPERIENCE

Full Stack Developer — Backend Lead

TrueCover | Remote | January 2025 – Present

- Work on backend microservices in **Node.js** and **FastAPI** — covering API design, Redis caching, input validation, and Docker-based deployments. Put a lot of effort into keeping error handling and logging consistent across services so debugging in production is actually manageable.
- Handle code reviews and collaborate with the frontend and DevOps teams day-to-day in a **Scrum setup**. Also built out some AI-powered features using LangChain on top of existing FastAPI services without disrupting what was already in production.

Software Developer

Triveni GlobalSoft | Surat, India | July 2023 – January 2025

- Built backend services and **REST APIs** using **FastAPI** and **Node.js**, with a heavy focus on database design across both PostgreSQL and MongoDB. Spent a good chunk of time on query optimisation and caching strategies that noticeably reduced response times and cloud costs.
- Developed a **RAG-based customer support system** end-to-end — from the FastAPI backend and vector database integration to structured output validation and error handling. Also mentored junior developers and ran internal training on LLM integration patterns.

Web & Mobile Application Developer

Zealousweb Technologies | Surat, India | June 2022 – July 2023

- Worked across several concurrent projects building applications with **REST API integrations**, WebSocket features, and Firebase backend services. Helped standardise the UI component library which made things move a lot faster across the team.
- Took on mentoring responsibilities for interns — ran code reviews, helped them understand the codebase, and made sure they weren't blocked for too long. Project delivery stayed consistent throughout.

Mobile Application Developer

Square Infosoft | Surat, India | June 2021 – March 2022

- Started my career building mobile apps with Flutter, integrating REST APIs and Firebase. Picked up strong habits early around testing and performance — the kind of discipline that carries through to backend work.
- Handled the full development cycle on multiple apps from initial build through to production deployment, which gave me a solid grounding in the SDLC before moving into larger team environments.

KEY PROJECTS

PromptForge — AI Prompt API Platform | Node.js, Next.js 15, PostgreSQL (Supabase), Prisma ORM, Anthropic SDK · 2025

- Designed the backend from scratch — PostgreSQL schema with Prisma ORM, streaming REST API routes using SSE, validation middleware, and RLS-based auth. Wired up CI/CD on Vercel so deployments are hands-off.
- Wrote unit and integration tests across all routes and kept error handling and logging consistent throughout the service layer.

AutoDM Pro — Instagram Automation Backend | Node.js, FastAPI, PostgreSQL, Celery, Redis, Meta Webhooks · 2025

- Built the distributed backend using **Celery and Redis** for async task queuing alongside Meta Webhook event processing. The PostgreSQL layer handles the data side with full error handling and retry logic baked in.

LLM Evaluation Pipeline | Python, FastAPI, GitHub Actions, Slack API · 2025

- Put together an automated backend testing pipeline with multi-dimensional scoring, GitHub Actions CI/CD, and Slack alerting. A good example of applying backend engineering discipline to AI systems.

Brand Research AI Agent | Python, FastAPI, LangChain, Serper API · 2024

- Autonomous research agent with self-evaluation loops, structured JSON output validation, and data aggregation across multiple external sources — minimal human intervention needed once running.

EDUCATION

B.Tech, Information Technology — P. P. Savani University, Surat | 2017 – 2021

Full Stack Developer Program — Pesto Tech (MAANG-focused Engineering Bootcamp) | November 2022 – April 2023
